3 open core cruncher for Linux Licensed under the GPL v2 Sourcecode: Documentation: Changelog: 2019-07-22: You can now select the font from a list, even if the font's not installed. 2019-07-12: Automatic batch import and font menu. 2019-07-08: Bugfixes and improvements. 2019-07-07: First release. The goal of this project is to make a convenient tool for creating a list of fonts. So basically you choose a font, and it will generate a.scr (that's the extension, just like .png) and a.scr file. You can run the scripts that creates the font list in batch mode. You can also use it to look up fonts in the list that you already have and add them to the font list. The list can also be exported as .json file. Installation Install the dependencies: sudo apt install texlive-binaries Unpack the archive and run the following commands: cd /usr/share/texmf-site/fonts/src make install The font files are moved to the directory where the.scr and.scr files are generated. To add new fonts just add them to the.scr file and run the batch import script. The list will be regenerated automatically. Usage Batch import cd /usr/share/texmf-site/scripts make install cd /usr/share/texmf-site/scripts/batch-import make install (cd /usr/share/texmf-site/scripts/batch-import/install-dependencies && \time texlua -d. \--no-interface --install-system-fonts install-font-files \--no-scripts \-e -c. \--init-paths. \-- 82157476af
